przy II Klin. Chorób Wewnętrznych A. M. Łódź. "Leczenie choroby nadeś-  
nieniowej serpasitem. Treatment of essential hypertension  
with serpasil." POL. TYG. LEK. 1956, 11/31 (1375-1378) Tables 1
- The authors present 25 patients treated with serpasil. all stationary forms of hypertension. No circulatory decompensation nor renal changes were found. Earlier treatment was without success. Serpasil was administered in daily doses of 0.3 to 0.7 mg. In 16 patients the complaints disappeared fully, in 6 cases they diminished. In 3 persons no subjective improvement was obtained. The systolic blood pressure diminished in all the cases within 40-60 mm. Hg, the diastolic blood pressure from 20 to 30 mm. Hg. The coronary flow improvement was established electrocardiographically in 3 cases. Retinitis hypertonica (phase I) disappeared in one case. The patients were observed 3 months to one year after withdrawal of the drug. This short time does not permit any definite conclusion to be drawn on the durability of treatment with serpasil.

"Dyspnea as a Problem of Working Capacity Assessment."

Prague, Casopis Lekaru Ceskych, Vol 105, No 35, 2 Sep 66, pp  
959 - 962

Abstract [Author's English summary modified]: Dyspnea is a symptom which accompanies many diseases; it is possible to see from the case history if the dyspnea is associated with a cardiac or pulmonary disease, general illness, obstruction of respiratory pathways, or if it has neurovegetative causes. The prognosis of the disease can be made on the basis of its causes and on the functional capacity of the cardiorespiratory system. No references. (Manuscript received Mar 66).

Abstract : The work of the Amur expedition organized by the Academy

of Sciences, USSR, and by the Academy of Sciences, Chinese People's Republic, to study the forests of the Amur basin is described briefly.

The program of the forestry detachment of the expedition proposes the solution of the following problems in the course of the next 3-4 years: 1) outlines of forest growing conditions with a subsequent delimitation of forest growing regions; 2) development of forest-growing typological characteristic of forests;

AUTHOR: Koldanov, V.Ya., Candidate of Agricultural Sciences

TITLE: Afforestation of Steppes of Our Country (Obleseniye stepey nashey rodiny)

PERIODICAL: Priroda, 1958, Nr 5, pp 31-38 (USSR)

ABSTRACT: Soil erosion and decreasing harvests are an ever increasing danger for Soviet agriculture. One of the principal causes of this danger is destructive lumbering. Since 1918, various schemes have been employed to overcome this. Planned afforestation is therefore considered the best remedy. The Institut lesa (Forest Institute) and the Pochyennyy Institut (Soil Institute) of the AN SSSR (USSR Academy of Sciences) are conducting scientific research as a guide to the kolkhozes and sovkhozes in their afforestation programs. Oak is the principal tree species planted in the new wood belts. Since 1947, wooded areas in the USSR's European steppe regions are on the increase. In the past 9 years all wooded areas grew by 1,446,000 ha. The extension of afforestation is reflected by the following figures: 6,000 ha before 1918, 190,000 from 1918 to 1948, over 650,000 from 1949 to 1953, and 130,000 from 1954 to 1956. A planned 3,000,000 ha will

Card 1/3

**Afforestation of Steppes of Our Country**

26-58-5-5/57

be afforested by 1965. This will apply in particular to the various parts along the banks of the Volga, Don, Dnepr, Desna and Oka rivers and of large water reservoirs. The Kamyshin-Stalingrad afforested wood belt comprising over 4,500 ha, has been taken over by the Goslesfond (State Forestry Reserve) as an accomplished project. In 1955, there were 546 reserves and 295 large tree nurseries in the European part of the USSR. Each reserve afforested 350 - 500 ha a year. This amounted to 190,000 ha annually. The biogeocenosis method worked out by V.N. Sukachev for naturally-grown forests will be adapted to the problems of steppe afforestation. At present, there are 12 state-planted forest belts in Azerbaydzhhan and two in the Kulundinskaya steppe. New belts are planned in the western parts of the Georgian SSR and in Uzbekistan. The Rostov, Stalingrad and Astrakhan Oblast's have wood belts covering several tens of thousands of hectares. Preparations are made for new wood belts on the banks of the Ural, Gora Vishnevaya rivers, the Caspian Sea shore, and for continuation of afforestation in the Saratov-Astrakhan belt on the Volga banks. The wood belts Penza-Kamensk and Voronezh-Rostov on the Don banks have been established and the Belgorod-Don wood belt has been completed

*A. PS.**J. Glass*

Architectural glass. N. O. Kostyuk, "Stol'nyye i Keram. Prom.", 1944, No. 8, pp. 20-21, etc., discusses the use of glass as structural and decorative material in buildings. As facing material, the possibilities of glass are innumerable. The range of possible colors, surface textures, and shapes is wide. The use of glass as facing material provides a hard, resistant surface that is easily

cleaned and freed of city dust and grime. It thereby insures a clean and fresh appearance regardless of its age. A building material referred to as glass-ceramic is made by adding crystallizing material, such as sand, clay, or other minerals, to glass. Cullet and other waste from the glass industry are mixed with these fillers, and the mixture is fired at approximately 600°. This process gives a very

decorative and resistant building material at low cost. Another product is cast slate, either white or colored. These are made in a manner similar to glass from locally available raw materials of earth nature as those commonly used for glass, combined with readily crystallizable materials. The cast slates are very strong and can withstand pressures up to 2000 kg. per cm.<sup>2</sup>. Another valuable raw material is metallurgical slag, which is suitable for casting slate and other building details. White and colored opaque glass is equally used as a facing building material. Floor tile is successfully made by casting from the same materials and in the same manner as that used in casting facing slate. This tile is more durable than lithotized marble. The same material is also successfully used for making stained-glass windows. The joining of the individual pieces by lead or brass formerly used is effectively replaced by heat joining. The individual pieces making up a pattern are arranged on a sheet of glass and fired together in a furnace. The complete window is then mounted as usual. This method permits the artist to use small fragments in making the patterns, and it produces a much more pleasing effect at a vastly reduced cost. Experiments were also carried out in color staining the glass. A method was developed for making glass hollow work by pricking and casting. Work has also been done on producing decorative building units, such as cornices; jamb patterns, relief images, etc., from transparent, opaque, and colored glass. The experiments were carried out in a laboratory and in a glass sculpture shop. M.H.

Title : Determination of Irregularities in Glass with Polarized Light

Orig Pub : Med. prom -st' SSSR, 1954, No 1, 39-42

Abstract : A method is proposed for determining the chemical irregularities of glass articles with the aid of polarized light. A specimen of glass, cut from the article, is thoroughly annealed, placed in an immersion liquid and viewed through crossed polaroids and with a compensation plate, producing a colored field. In the author's opinion, this method can be recommended for production control and for an estimate of the chemical homogeneity of glass articles.

**REFRETS:**  
More than 500 specialists participated in the scientific and technical conference on Soviet aerophotography and space held from October 22 to 26, 1957. The following persons were in the honorary assembly of the conference: A. M. Baranov, General Secretary of the Central Committee of the CPSU, Gen. "Soviet Leader," Aerophotography, and the Department of the National Front; "The Present State and Perspective Development of Geography in the USSR," Professor G. F. Romanov; "The Present State and Perspective Development of Mathematics," Professor P. N. Zubakov; "The Present State and Perspective Development of Geodesy," Professor V. N. Kostylev; "Today's Fundamental Problems and Tasks of Perfecting the Map," Dr. B. Balanda; "The International Geophysical Year," Soviet Participation in the International Geophysical Year. In the section on geography reports were given by the following persons: V. A.

TITLE: The Representation of Rocks on Topographical Maps (Izobrazheniye skal na topograficheskikh kartakh) By Way of Discussion (V poryadke obsuzhdeniya)

PERIODICAL: Geodeziya i Kartografiya, 1958, Nr 5, pp. 45-48 (USSR)

ABSTRACT: The sign on geographical maps of large scale which is used in order to denote rocks does not represent all existing types of rocks and elevations of the soil. A more distinct and accurate method of showing rocks on a map is given, from which also the distribution and the shape of the rocks may be seen. For this purpose it is necessary to take the following measures when composing geographical maps according to aerial photographs:  
1.) The structural lines of rock-formations and the contours of rock areas on aerial pictures must be evaluated and marked. Further, they must be brought into line with the horizontals and with the elements of hydrography. 2.) On the originals of the maps hachures of rocks must be plotted. - The structural lines must be drawn at the edges of the shade in order that the shape of the rocks becomes distinctly visible. In the case of particu-

Card 1/2

The Representation of Rocks on Topographical Maps. By Way of

6-58-5-8/17

larely fine sections of rocks the structural lines may be omitted. The contours of rock sections must, however, all be plotted. When plotting soil elevations in the rock sections no horizontal lines must be drawn. Hachure must show the general shape of a soil elevation as well as its individual parts. Therefore the shaded slopes are not completely hachured, but some light spots must be left. It is advisable that the plotting of structural lines on aerial pictures and the work of hachure on the originals be always carried out by one and the same person. There are 2 figures.

Report. This collection of articles is intended for specialists in geodesy, cartography, and photogrammetry.

**CONTENTS:** The book is a compilation of 20 papers presented at the XII All Union Conference on Problems of Photogrammetry and Cartography held in October 1977 and organized by the Ministry of Geodesy. The reports presented discuss the current state and prospects of development of aerial photography, topographic mapping, other types of surveying, and products of aerial photography; photogrammetric methods, geometry and products of stereometry, instrumentation, mathematical and physical problems. No generalities are mentioned. References are given below all the articles.

TITLE: Some peculiarities of the preparation of rubber mixes in a two-speed rubber mixer

PERIODICAL: Kauchuk i rezina, no. 10, 1961, 39 - 41

TEXT: Experiments were conducted on the new two-speed rubber mixer DPC-140 (DRS-140) manufactured at the Kiyevskiy mashinostroitel'nyy zavod (Kiyev Machine-Building Plant) "Bol'shevik", according to designs of the NIIKhIMmash. Its rotors have 19.76/16.76 and 39.52/33.5 rpm, respectively. The capacity of the mixing chamber is 245 liters, the size of the spaces between the blades of the rotors and the walls of the mixing chamber 6-7 mm. Results of the experiments showed that when preparing casing-breaker mixes in the rubber mixer at 40 rpm a mixing duration of 1.5 min without taking into account the loading and unloading, and a specific pressure of the upper press of  $3.7 \text{ kg/cm}^2$ , the volume of the load may be brought to 165 liters without impairing the quality of the mix. The loading coefficient of the chamber of the DRS-140 rubber mixer is 65%. Thus

Koldinský, O.

✓ 1801. Comparative titrations in pharmaceutical analysis. XIII. Determination of bismuth. V. Šuk, O. Koldinský and M. Halík (Inst. Anal. Chem., Karlovy Vary Univ., Prague, Czechoslovakia). Českos. Farmac., 1965, 4 (9), 449-451.—Catechol violet forms an intensely blue complex with bismuth at pH > 2. On titrating a bismuth soln. with EDTA (disodium salt) in the presence of this indicator the colour of the soln. changes sharply to yellow at the equivalence point. If the original soln. is violet instead of blue it is too acid and should be adjusted

to a pH of 2 to 3 with aq. NH<sub>3</sub>. The method is applied to a number of inorganic and organic bismuth compounds, the error for the former being <0.4 per cent. and for the latter <±1 per cent. Among the compounds examined were basic bismuth gallate, iodogallate, salicylate and tribromophenoxyde. The organic matter was destroyed before the titration by heating with HNO<sub>3</sub> and H<sub>2</sub>O<sub>2</sub>.

TITLE: Complexometric Titration in Pharmaceutical Analysis. XVIII. The Determination of Bismuth in Mixtures.

ORIG. PUB.: Ceskoslov Farmac., 7, No 5, 249-251 (1958)

ABSTRACT: The complexometric method for the determination of Bi using Pyrocatechol Violet as indicator has been applied to the quantitative determination of Bi in various pharmaceutical mixtures: in powders, tablets, blends, and ointments. In a number of medicinal preparations Bi was determined in mixtures with Mg and Hg. For Communications XVII see RZhKhim., 1959, No. 14, 50715. *From authors' summary*

Some indexes of the protein metabolism and the functional state of liver in patients suffering from cerebral tumors. L. S. Cherkasova, P. D. Kokolskaya, V. A. Kukushkina, and E. I. Shnyak (Inst. Physiol., Acad. Sci. White Russian S.S.R., Minsk). *Izvest. Akad. Nauk Belorus. S.S.R.* 1955, No. 3, 127-30 (in Russian).—Data are presented for the amts. of total protein, albumin, globulin, fibrinogen, and the protein index; the activities of the proteolytic and aminolytic enzyme; and the amt. of amino acid N (mg. %) polypeptide and urea N fractions of the blood in 21 patients suffering from cerebral tumors. Non-protein N increases during the illness, the increase being due to the accumulation of polypeptides, since the amts. of free amino acids and urea remain nearly unchanged. The normal proportion of albumin to globulin is disturbed and the enzyme activities lowered; the detoxicating capacity of the liver (Quick-Pytel method) is also greatly decreased as a result of the illness. R. Wierchicki.

TITLE: Effect of neutron irradiation on tissue metabolism processes

SOURCE: Radiobiologiya, v. 6, no. 2, 1966, 179-184

TOPIC TAGS: neutron irradiation, radiation biologic effect, tissue physiology, animal experiment, ~~biological metabolism~~

ABSTRACT: In order to clarify the effect of neutron bombardment on carbohydrate, energy, and protein metabolism at relatively low doses, the changes in free and bound glycogen, glucose-1-phosphate, glucose-6-phosphate, fructose-1, 6-diphosphate, triose-phosphate, phosphopyruvate, ATP, creatine phosphate, phosphorylase, amylase, succinic dehydrogenase, respiratory quotient, and protein content were determined in the central nervous system, skeletal muscle, and liver of adult white rats 15 — 30 days after total body irradiation with neutrons having energies of 0.04 — 1.35 Mev (total dose of about 13 rad in 60 min).

TITLE: Growth of large finite crystals of triglycin sulfate in laboratory conditions

SOURCE: Akademiya nank SSSR. Institut kristallografii. Rost kristallov, v. 3, 1961, 278-282

TEXT: The authors studied the growth of triglycin sulfate crystals—  
 $(\text{NH}_4\text{CH}_2\text{COOH})_3\text{H}_2\text{SO}_4$ —from aqueous solutions in the temperature interval  
20 – 55° by the method of reversible mixing. Previous work by E. A. Wood et al shows that these crystals which structurally belong to the dihedral axial class of monoclinic syngony possess strong magneto-electrical properties: a high dielectric non-linearity, a highly rectangular hysteresis loop, high piezoelectric moduli, and a low dielectric permeability. Other characteristics include the disappearance of spontaneous polarization above 47°, the predominance of m{110} and c{001} faces below 55°, a

perfect 010 cleavage, a segneto-electrical axis coincident with the polar axis  $L^2$ , an axial bisector coincident with the x-axis, and a curie-point of  $47 - 49.3^\circ$ . In the experimental procedure followed by the authors, a crystallizer—a sealed glass cylinder containing the crystal-carrier, a glass tube with a pivotal primer, with a saturated and purified solution of triglycin sulfate—is placed in a sealed glass water-bath with a thermostat—overheated by  $5^\circ$  in comparison with the solution—motor, heater, mixer and refrigerator. The optimum temperature for crystal-growth is established visually, and stirring is commenced as soon as this occurs, the growth rates along the x-, y- and z-axes being 5.6, 7.3 and 1.9 mm/24 hours respectively. It is noted that large homogeneous crystals cannot be grown in all cases owing to their high sensitivity to changes in the degree of supersaturation and mixing of the solution which increase the crystal complexity and the number of liquid inclusions and parasitic growths. During unilateral rotation, a zone of weak mixing develops at each acute angle, leading to the formation of inclusions on the crystal faces; this does not happen, however, with reversible rotation. On adding
